

# INSTRUCTIONS

## Kosova Makers League – Round 4

**Date of announcement: 12.04.2019**

Given the difficulties that you may encounter during programming, you are instructed to practice robot movements by combining them with different sensors. The sensors you can exercise during these days are the Ultrasonic Sensor, Line Follower as well as the Light Sensor.

In the fourth round challenge it is foreseen for you to place a tunnel where the robot will pass through it. Here we have decided to evaluate your creativity as well. You can use different materials to decorate the tunnel; such as colors, plasticine, rice, etc.

At the same time your robot can be masked to play a certain role and perform a special function for others. In this section you will have more detailed instructions in the final document of the fourth round.

Pay attention, you will have only 4 days from the time the challenge is posted to prepare the fourth challenge. The challenge will be published on April 22 and the videos will be accepted to the Kosova Makers League group at Vimeo until April 25.
